

*With FlexStake™ FH  
there are less major injury claims  
and you save time hunting water.*

### **Utility**

FlexStake™ FH can be flexed in any direction without damage. When the post is bent over and released, the memory in the flexible hinge slowly returns the post to its original upright position. However, the hinge is so supple that a fireman can easily bend the post out of the way to access the operating nut and steam and port caps.<sup>1</sup> Hoses do not become entangled or cut, as they do with posts made of wood, fiberglass or steel.

### **Design**

FlexStake™ FH puts safety first. The hollow Bayer configuration extrusion is securely closed at the top to keep out foreign objects. The mounting bracket and post end are rounded to prevent injury to children, pets, and fire hoses. As an additional safety measure, the hinge return action is slowed so that the post cannot be used as a whip or catapult. The post is highly visible, fade resistant and virtually indestructible in normal use.

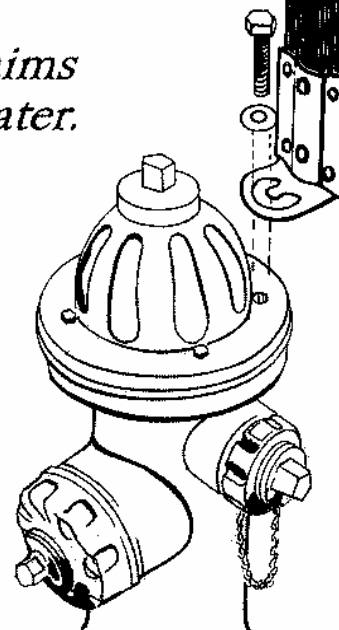

### **Versatility**

FlexStake™ FH is an all weather product. Operating temperature is from extreme heat to extreme cold. Color impregnated polycarbonate is very strong and resistant to UV damage. The post will remain sturdy and color-bright for many years. Standard colors are: White, Red, Orange, Yellow, Green, Blue, Brown, and Gray. Reflective tape and Hydrant Decals are moderately priced optional extras.

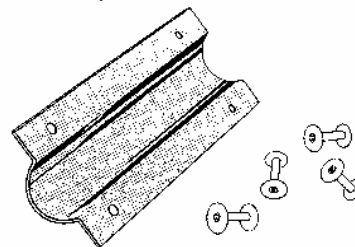

### **Vandal Resistant**

FlexStake™ FH, properly installed, is impossible to remove by hand, and difficult to break. Steel or fiberglass posts can be totally destroyed when bent 90°, and can become dangerous safety hazards. Our posts can be flexed thousands of times and remain serviceable.<sup>1</sup>

Weight: 25 oz. - each post and bracket unit.

FlexStake™ FH is fastened right on to the hydrant itself. No expensive tools or digging! Here's how it's done: Temporarily remove one bonnet bolt. Align the post's mounting bracket over the hole in the bonnet. Slide a large flat washer over the bolt, and run the bolt back through the mounting bracket and bonnet. The universal bracket may now be oriented up to 90° in either direction for maximum visibility. Tighten the nut securely. Five minutes, and you're done. What could be simpler?

In the unlikely event that a post is crimped, the above inexpensive repair kit can save time and money. Available in all standard post colors.
